Profile

Backend developer in my first year of full-time work, currently responsible for an in-house accounting and supply-chain system — the services behind it, the internal tools the finance team uses, and the documentation that goes with them.

Working where a mistake turns into a wrong number someone has to explain has taught me to put correctness and clear handover ahead of speed. I want to keep going that way: understand the business process first, automate it second, and grow into system design at a wider scope. I read English technical documentation daily and write my own in English.

Skills

- Business & accounting:** Double-entry posting and general ledger, payables and receivables, period closing, master-data governance.
- Systems & integration:** Service design that holds up under retry and concurrency; incremental sync at volume; batching, backoff and failure handling; connecting systems that were never built to talk to each other.
- Platforms & languages:** TypeScript, Node.js, SQL; Azure Functions; Dynamics 365 / Dataverse; Power Platform; Power BI; FAST Accounting and MISA integrations. Also NestJS, React, Vue, Java, PostgreSQL, MongoDB.
- Beyond code:** Technical and end-user documentation; support for non-technical users; Agile delivery; team leadership.

Work Experiences

Nov 2025 — Present

Tech Officer — Backend Engineer

WeCare Group · Quy Nhơn, full-time

- Designed a configuration-driven posting engine.** Accounting rules are resolved from configuration at runtime, so a new transaction type is configured rather than coded. Entries are proved balanced before they are written, blocked outside an open period, and posted once per business case — retries and concurrent flows cannot duplicate.
- Replaced ad-hoc imports with one sync pipeline.** Master data drifted between systems: duplicate codes, missing fields, large loads timing out half-finished. Incremental sync, writes keyed on the business code, dependency ordering and bounded batching now keep ~20K records in step unattended.
- Decided where automation should stop.** Invoice-line matching settles predictable cases with deterministic rules and escalates only genuinely ambiguous ones to an AI agent — cheaper to run, and still explainable to the accountants who review it.
- Root-caused a data-isolation defect in production.** One customer's ledger rows were surfacing under another; the query filtered only one side of the account relationship. Corrected both positions, then reconciled against the trial balance before closing it.
- Handed the system to the people who run it.** Wrote the operating manual and an end-user guide organised by situation rather than by document number, and ran UAT on production with those users before go-live.

Nov 2025 — Jul 2026

Frontend & Mobile Developer

Âu Châu Education · freelance · team of 10

- Staff dashboard the offices run on day to day.** Students, parents, classes, schedules, exams, course materials and tuition in one place across several centres, with receipt documents generated on the server instead of rebuilt by hand in spreadsheets.
- Student mobile app delivered alongside it.** Course content, attendance, homework and tuition status, with push notifications and bilingual screens. I handled the sign-in and token-refresh flow and the local caching that keeps the app usable on a weak connection.
- Shipped to both platforms from one codebase** on a single release process, and followed each feature from what an administrator enters on the dashboard through to what the student sees on their phone.

May – Aug, 2024

Backend Developer

PAXU · MMS Software · freelance · team of 7

- Backend for a personal-finance product.** Spending management, borrowing and repayment capacity, fee estimation, and cost-of-living comparison.
- Led a platform upgrade on a live system.** Moved the application framework and database across several major versions, sequenced so existing users kept working throughout.

May – Aug, 2024

Migration Developer — On-the-Job Training

FPT Software Quy Nhơn · team of ~40

- Enterprise content migration.** Moved and validated pages out of legacy systems, checking data consistency and content integrity across environments before each cut-over.
- Quality gate.** Maintained the QA checklists used to accept each migrated page, so problems were caught before they reached the next environment.
- Delivery discipline at scale.** Worked to a formal task workflow inside a ~40-person project — my first experience of how a team that size stays coordinated.

Education

Sep, 2021 – Nov, 2025

Major: Software Engineering

at FPT Quy Nhon University AI Campus

GPA: 3.2 / 4
