PROFILE

Backend developer in my first year of full-time work, currently responsible for an in-house accounting and supply-chain system — the services behind it, the internal tools the finance team uses, and their documentation.

Working where a mistake turns into a wrong number someone has to explain has taught me to put correctness and clear handover ahead of speed. I want to keep going that way: understand the business process first, automate it second, and grow into system design.

SKILLS

Business & accounting

Double-entry posting and general ledger, payables and receivables, period closing, master-data governance.

Systems & integration

Service design that holds up under retry and concurrency; incremental sync at volume; batching, backoff and failure handling; joining systems never built to talk to each other.

Platforms & languages

TypeScript, Node.js, SQL; Azure Functions; Dynamics 365 / Dataverse; Power Platform; Power BI; FAST and MISA integrations. Also NestJS, React, Vue, Java, PostgreSQL, MongoDB.

Beyond code

Technical and end-user documentation; support for non-technical users; Agile delivery and team leadership.

English

Working-level reading and writing; conversational speaking. I read API specs and technical docs daily, and write commits, pull requests and documentation in English.

EDUCATION

B.E. Software Engineering

FPT University, Quy Nhơn Campus
Sep 2021 — Nov 2025 · GPA 3.2/4

WORK EXPERIENCE

Tech Officer — Backend Engineer

Nov 2025 — Present

WeCare Group · Quy Nhơn, full-time

- **Designed a configuration-driven posting engine.** Accounting rules are resolved from configuration at runtime, so a new transaction type is configured rather than coded. Entries are proved balanced before they are written, blocked outside an open period, and posted once per business case — retries and concurrent flows cannot duplicate.
- **Replaced ad-hoc imports with one sync pipeline.** Master data drifted between systems — duplicate codes, missing fields, loads timing out half-finished. Incremental sync, writes keyed on the business code, dependency ordering and bounded batching keep ~20K records in step unattended.
- **Built the internal tools the finance team works in.** Payment approval that routes through several levels and clears low-value items automatically, plus screens for reconciling sales and purchase documents, each scoped by role. Bulk approval re-reads a record's real state before writing, after stale screens let steps be approved out of order.
- **Decided where automation should stop.** Invoice-line matching settles predictable cases with deterministic rules and escalates only genuinely ambiguous ones to an AI agent — cheaper to run, and still explainable to the accountants who review it.
- **Reporting the finance team can run themselves.** An account detail ledger with correct opening and running balances, an account hierarchy that rolls up at any level without double-counting, and a procurement view that surfaces goods received without documents and unit-price differences.
- **Root-caused a data-isolation defect in production.** One customer's ledger rows were surfacing under another; the query filtered only one side of the account relationship. Corrected both positions, then reconciled against the trial balance before closing it.
- **Handed the system to the people who run it.** Wrote the operating manual and an end-user guide organised by situation rather than by document number, and ran UAT on production with those users before go-live.

Frontend & Mobile Developer

Nov 2025 — Jul 2026

Âu Châu Education · freelance · team of 10

- **Staff dashboard the offices run on day to day.** Students, parents, classes, schedules, exams, course materials and tuition in one place across several centres, with receipt documents generated on the server instead of rebuilt by hand in spreadsheets.
- **Student mobile app delivered alongside it.** Course content, attendance, homework and tuition status, with push notifications and bilingual screens. I handled the sign-in and token-refresh flow and the local caching that keeps the app usable on a weak connection.
- **Shipped to both platforms from one codebase** on a single release process, and followed each feature from what an administrator enters on the dashboard through to what the student sees on their phone.

Backend Developer

Jun — Jul 2025

PAXU · MMS Software · freelance · team of 7

- **Backend for a personal-finance product.** Spending management, borrowing and repayment capacity, fee estimation, and cost-of-living comparison.
- **Led a platform upgrade on a live system.** Moved the application framework and database across several major versions, sequenced so existing users kept working throughout.

Migration Developer — On-the-Job Training

May — Aug 2024

FPT Software Quy Nhơn · team of ~40

- **Enterprise content migration at scale.** Moved and validated pages out of legacy systems, checked data consistency across environments, and maintained the QA checklists used to accept each page — my first experience of a formal delivery process in a large team.
